

ABC's New Wall and Deck Brackets

ABC Sign Products has produced new extruded aluminum Wall and Deck Brackets. These parts make the mounting of our Deck Cabinet safer and faster.

The attached drawing illustrates the two parts. They are extruded of 6061 alloy for higher strength.

Both parts have a drill-guide groove located as shown for drilling bolt holes for the Wall Bracket and also for the Deck Bracket if they are to be bolted instead of welding or to augment welding.

Both the Wall Bracket and Deck Bracket may be purchased in 20' lengths.

Note that the receiver-slot in the Wall Bracket is

.250" wide to make the insertion of the .187" Deck Bracket easy, and to allow it to slide sideways in the Wall Bracket.

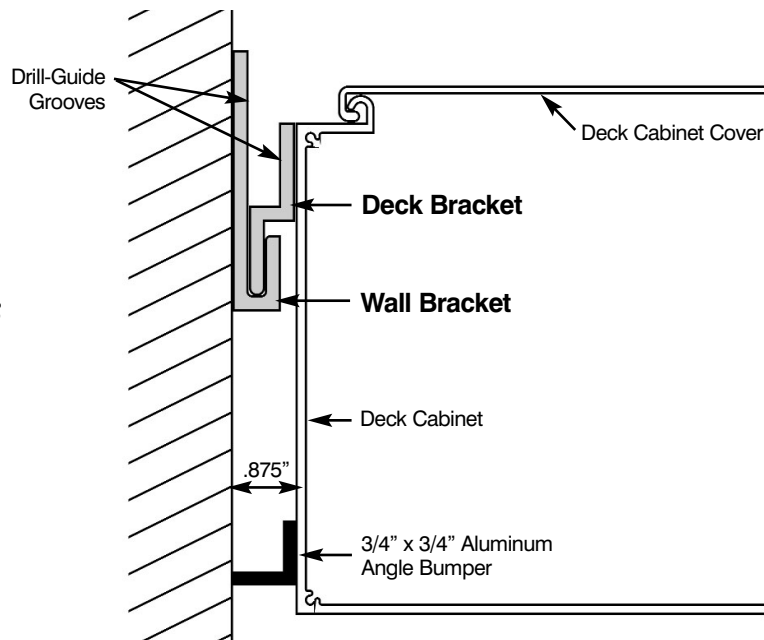

Because the weight of the deck cabinet with transformers and letters is cantilevered out from the brackets, bumpers should be attached in short, intermittent sections and at each end to keep the sign plumb.

We know crane and crew time is expensive when working in the field. These parts will make this type of installation quicker and less costly.

The Wall and Deck Brackets are another example of how ABC's fifty years of experience of designing parts for sign companies benefits our customers.

Deck Brackets
